

The First 50,000 t/a Household Paper Production Line of Fushun Mining Group Put into Operation

On December 19, 2011, the first 50,000 t/a household paper production line of Fushun Mining Group Co., Ltd. was commercially put into operation.

The 2 million tons paper project of Hupo Paper is one of the key projects aiming to transform the Fushun Group. It will be constructed in two phases. For the first phase, RMB 6.457 billion will be invested to construct a 1.1 million t/a paper project that includes two household paper production lines, one paperboard production line and one corrugating medium production line. The design and the construction of the first phase were started simultaneously in April 2011. The first household paper production line commercially putting into operation adopts production technology of Andritz that includes advanced high-temperature sterilization and special refining processes.

It can produce and process high quality household paper products . Currently, the household paper production line produces 180 t/a of high-grade roll tissue, removable tissue, handkerchief paper and napkin paper. The products are sold in three brands and seventy types, targeting both general and middle and high end consumer groups.

It is known that the paper project of Fushun Mining Group adopts environmentally-friendly and highly efficient technologies and production equipment, and is therefore a green project. The small quantity of wastewater generated during the production process is treated in a self-built wastewater treatment plant. The effluent discharged meets the national standard. The solid waste residue is burned for power generation. ▮
